Human Amniotic Membrane: Basic Science And Clinical Application - Abdul Aziz Nather 2017-08-23

This book is a comprehensive guide for all tissue bank operators to screen, procure and process amniotic membrane for clinical application. The amnion comes close to being the ideal biological membrane or dressing — readily available, inexpensive to procure and process. Its basic science is discussed in detail — anatomy, biological and biomechanical properties. It can be procured from the placenta in normal vaginal deliveries and from Caesarean Sections. Processing is by freeze-drying or by air-drying process with sterilisation using gamma irradiation. The product has low antigenicity, has anti-microbial properties with ability to enhance epithelisation with marked relief of pain. It is useful as a dressing for wounds — flap wounds, burn wounds, injury wounds, diabetic ulcers, leprosy ulcers and post-surgery wounds and post-radiation wounds. It is also used as a biological scaffold for cells in tissue engineering. Its ophthalmic applications include treatment of corneal ulcers and conjunctival tumours. Oral uses include gingiva depigmentation and periodontal regeneration.

Eyelid Tumors - Arnab Biswas 2014-06-27

Eyelid tumors are commonly encountered by oculoplastic as well as plastic surgeons. The challenge of managing these cases lies not only in performing the surgery in a precise manner in small area, but also in ensuring a visually-appealing cosmetic outcome. This is an innovative and concise portable handbook that

guides the surgeons on how to approach and manage these cases in a step-by-step manner. Each chapter of this practical guidebook has outstanding illustrations drawn in full color clearly showing each incision line, flap management, suture placement and its technique and the expected cosmetic outcome. When a lid tumor is excised, there is a tissue defect that needs to be corrected. Ophthalmologists and plastic surgeons will find this work an excellent reference material to solve the jigsaw puzzle of tissue defects in and around the periorbital region. Importantly, they can quickly refer to the images just before starting a procedure. The author has first explained the anatomical aspects and anesthetic techniques for eyelid surgery, followed by review of the benign and malignant tumors, finally describing the flap creation and reconstruction techniques that are currently used in various lid tumors in an organized fashion.

Emergencies of the Orbit and Adnexa - Bipasha Mukherjee 2016-12-15

This handbook on orbital, lacrimal and eyelid emergencies deals with such situations in a practical manner guiding the ophthalmologists in accurate handling and making them more proficient and confident in managing vision and life-threatening emergencies. With 51 chapters and more than 350 images, this book covers all the eye emergencies that generalist and specialist ophthalmologists can expect to come across in their day to day practices. It can be argued that the orbit can no more be called 'Pandora's Box' because of the unpredictable nature of its contents. This perception has changed over the years due to the advent of improved diagnostic, in particular, imaging techniques. However, since medical residency provides very little exposure to orbital and adnexal disorders, most clinicians are inexperienced and unsure about their management. Facing an emergency situation where improper management can rapidly worsen the

condition leading to blindness or even death of the patient is every ophthalmologist's nightmare. The emergent nature of these conditions does not always provide for a leeway to refer these patients to an orbit and oculoplasty specialist, who are few and far between. By the time the patient reaches his destination, his vision maybe irrevocably lost. The legal implications of such mismanagement can be significant too. This book is a quick and essential resource to manage and refer eye emergencies with confidence.

Recent Advances in Burns and Plastic Surgery — The Chinese Experience - Tisheng Chang 2012-12-06

In 1958; a severely burned steel worker, the extent of whose burns was 890/0 of the body surface, with 20070 of third degree burns, was saved by the Kwangts'e hospital (now the Rui Jin hospital) of Shanghai Second Medical College. It was the first report in the world of such a critically injured patient recovering, and seemed like a miracle at that time. During the 24 following years, a great number of papers reporting the development and advances in burn therapy in clinics and in research showed that Chinese medical investigations in the field of burns have ranked among the most advanced in the world. Plastic surgery, as an independent branch of general surgery, has been established gradually since Liberation. Recently, new techniques, including microsurgical techniques, in plastic surgery have emerged and developed, permitting rapid progress in clinical work and attracting attention and appreciation in other parts of the world. The first national congress of Burns and Plastic Surgery was held from May 16-24 1982 in Shanghai. Over 800 papers were presented and showed how advances have been made in recent years in these two specialities. Here we present selected articles as a symposium. It is hoped that this symposium will be of value to its readers. About the Editors Chang Ti-sheng (Zhang Di-sheng), who was born 12 June 1916, is Professor of Surgery, Shanghai Second Medical College, Shanghai, Chief of the Department of Plastic and Reconstructive Surgery, and Director of Shanghai Ninth People's Hospital, Shanghai.

Mohs Micrographic Surgery - Stephen N. Snow 2004

Mohs Micrographic Surgery, an advanced treatment procedure for skin cancer, offers the highest potential for recovery—even if the skin cancer has been previously treated. This procedure is a state-of-the-art treatment in which the physician serves as surgeon, pathologist, and reconstructive surgeon. It relies on the accuracy of a microscope to trace and ensure removal of skin cancer down to its roots. This procedure allows dermatologists trained in Mohs Surgery to see beyond the visible disease and to precisely identify and remove the entire tumor, leaving healthy tissue unharmed. This procedure is most often used in treating two of the most common forms of skin cancer: basal cell carcinoma and squamous cell carcinoma. The cure rate for Mohs Micrographic Surgery is the highest of all treatments for skin cancer—up to 99 percent even if other forms of treatment have failed. This procedure, the most exact and precise method of tumor removal, minimizes the chance of regrowth and lessens the potential for scarring or disfigurement
