Plant Molecular Biology — A Laboratory Manual - Melody S. Clark 2013-11-27
Covering the whole range of molecular biology techniques - genetic engineering as well as cytogenetics of plants -, each chapter begins with an introduction to the basic approach. followed by detailed methods with easy-to-follow protocols and comprehensive troubleshooting. The first part introduces basic molecular methodology such as DNA extraction, blotting, production of libraries and RNA cloning, while the second part describes analytical approaches, in particular RAPD and RFLP. The manual concludes with a variety of gene transfer techniques and both molecular and cytological analysis. As such, this will be of great use to both the first-timer and the experienced scientist.

Molecular Microbial Ecology Manual - A.D. Akkermans 2012-12-06
For a long time microbial

ecology has been developed as a distinct field with in Ecology. In spite of the important role of microorganisms in the environ ment, this group of 'invisible' organisms remained unaccessable to other ecologists. Detection and identification of microorganisms remain largely dependent on isolation techniques and characterisation of pure cultures. We now realise that only a minor fraction of the microbial community can be cultivated. As a result of the introduction of molecular methods, microbes can now be detected and identified at the DNA/RNA level in their natural environment. This has opened a new field in ecology: Molecular Microbial Ecology. In the present manual we aim to introduce the microbial ecologist to a selected number of current molecular techniques that are relevant in micro bial ecology. The first edition of the manual contains 33 chapters and an equal number of additional chapters will be added this year. Since the field of molecular ecology is in a continuous progress, we aim to update and extend the Manual regularly and will invite anyone to deposit their new protocols in full detail in the next edition of this Manual.

A Dissection and Tissue Culture Manual of the Nervous System - Abraham Shahar 1989-12-05

At last ... a collection of practical protocols for explanting and manipulating neuronal and glial cells. A Dissection and Tissue Culture Manual of the Nervous System Abraham Shahar, Jean de Vellis, Antonia Vernadakis, and Bernard Haber, Editors Among research laboratories involved with neuronal and glial cell cultures and their applications, there is a growing demand for a hand-book describing dissection procedures, culture preparation techniques, and the in vitro manipulation of neural cells and tissues for specific analytical purposes. A Dissection and Tissue Culture Manual of the Nervous System offers a diverse collection of methods that have been developed by and are used routinely within specialized neurobiological laboratories. Written in an easy-to-follow style, the procedures described in this unique guide are designed by experts to be applied by those with limited experience in the field. Organized into ten comprehensive sections, ninety concise contributions from leading laboratories worldwide put forth practical, stepwise protocols for neural cell manipulation and experimentation. Methods encompass: an illustrated outline of techniques for the dissection of brain areas in the fetus and the neonate the dissection of selected specialized structures, such as the ciliary ganglion organotypic. explant culture of nervous tissue dissociated culture of astrocytes, oligodendrocyte, neurons, and Schwann cells reaggregation culture of dissociated cells. Sections devoted to various tissue processing methods and experimental applications of

cultured material present histochemical, autoradiographic, and immunocytochemical staining and visualization techniques. In situ hybridization methods, as well as preparative procedures for electron microscopy and biochemical and physiological assays, are discussed with an emphasis on methods tailored for the neurobiologist. Alternative techniques for the cultivation of the same organ or cell type from diverse animal species are juxtaposed with a varied selection of methodology and instrumentation, and complemented by key literature citations for further reading, to enable the investigator to chose the appropriate approach for a specific neurobiological application. Presented in a comb-bound format for convenient use on the laboratory bench, A Dissection and Tissue Culture Manual of the Nearvous System will be an essential research companion to graduate students, post-doctoral fellows and other laborabory investigators in cell and developmental neurobiology, neuroanatomy, neurophysiology, neuropharmacology, and biochemistry.
