*Building Code Basics: Energy* - International Code Council 2013-05-02

As energy conservation continues to become an increasingly important factor in building construction, BUILDING CODE BASICS: ENERGY is a book that is more relevant and

more valuable than ever before. Designed to provide a straightforward, easy-to-read guide to the International Energy Conservation Code (IECC), it fills an informational gap that exists between the code itself and the tactical reference information needed to properly apply

it in a real-world setting. This book provides solid, working information on critical energy code applications for residential and commercial construction without the text-heavy, complex, and sometimes abstract language that complicates many of the more traditional code-related products. Coverage includes the basics of the IECC, including essential requirements and reasons for the code provisions. This thorough coverage, combined with the book's organized, user-friendly and practical approach, makes BUILDING CODE BASICS: ENERGY a critical addition to any professional or reference library. **Applying the Building Code** - Ronald L. Geren 2016-03-21

No other resource—not even the building code—presents the exact code information you need, when you need it at design stage The International Building Code (IBC) is a model building code developed by the International Code Council (ICC). The IBC and its complementary codes provide design and construction professionals with a complete set of comprehensive, coordinated building safety and fire prevention regulations in order to safeguard the public health and general welfare of the occupants of new and existing buildings and structures. Adopted throughout most of the

United States and its territories, it is referenced by federal agencies, such as the General Services Administration, National Park Service, Department of State, U.S. Forest Service, and the Department of Defense. For architects and other design and construction professionals, it is particularly important that they understand how to apply the IBC and how code officials view buildings, so that they integrate code-required provisions in the earliest design stages of any project. Applying the IBC, as well as its companion codes, to building design is a process that is uniquely different to that of applying the building code during a planning review. Whereas other guide books explain the IBC in sequential order, from cover to cover, chapter by chapter, and section by section, Applying the Building Code explains the requirements of the IBC as they would apply during the common phases of design: from schematic design through to the preparation of construction documents. This effectively highlights applicable requirements of

the building code at the appropriate stage of design based on available information. The book provides a 28-step process that is organized according to the three phases of architectural design: schematic design, design development, and construction documents Each step explains the application of the IBC, as well as other codes and standards referenced by the IBC (i.e. International Fire Code, International Energy Conservation Code, and ANSI A117.1) based on available project information Illustrations and examples are provided throughout that explain the code fundamentals associated with each step A single example project is used throughout the step-by-step process to illustrate how each step is applied and builds upon code and project information obtained through previous steps Guidance is also provided on the International Existing Building Code and how the step-by-step process is applied to projects involving existing buildings The role of the building department and its staff in regard to plan reviews and code

enforcement is discussed A detailed code data information template is provided that can help organize code-related information for construction documents

*Prefabulous + Almost Off the Grid* - Sheri Koones 2012-11-15

A beautiful, user-friendly overview to building more energy-efficient and environmentally friendly homes using prefabrication. *Prefabulous + Almost Off the Grid* explores the many ways of using prefabrication to build beautiful homes that are not only environmentally friendly, but also incredibly energy efficient. Profiling more than thirty of the most energy-efficient homes in the United States, this user-friendly guide reveals how homebuilders can achieve similar results—whether they want to earn an advanced green certification or just incorporate a few energy-saving measures—with the help of floor plans, detailed resource lists, explanations of the latest technologies, and brilliant photographs. Author Sheri Koones shows that building green

doesn't have to be more expensive, and in fact, can lead to dramatic savings. Koones's almost-off-the-grid homes, which take energy from the grid when necessary and return any excess energy produced, are healthier, quieter inside, and far cheaper to operate. As energy costs continue to rise, energy independence is becoming increasingly essential, and as this guide shows, the almost-off-the-grid home is a solution that is achievable for everyone.

Recipient of the 2013 Robert Bruss Gold Book Award from the National Association of Real Estate Editors (NAREE) Praise for *Prefabulous + Almost Off the Grid* "The time has come to throw out the old stereotypes and to embrace prefab building techniques as the way of the future?and the best approach for today. For anyone wanting to create a house that's sustainable in every sense of the word, this book is an excellent place to start." —Sarah Susanka, architect and author of *The Not So Big House* series "You can build a high quality, environmentally friendly and

efficient home at a reasonable price with a look and feel of a traditional home. Advancements like those used in our house and the other houses in this book will transform the homebuilding industry.” —Christine Todd Whitman, former governor of New Jersey and administrator of the Environmental Protection Agency “This is an easy-on-the-eyes guide that includes floor plans and multiple images of the exterior and interior of each home. It is not a manual for green construction, but a general overview of aspects of prefab and green construction. And it does that well.” —Natural Life magazine

Human Dimension and Interior Space - Julius Panero 2014-01-21

The study of human body measurements on a comparative basis is known as anthropometrics. Its applicability to the design process is seen in the physical fit, or interface, between the human body and the various components of interior space. Human Dimension and Interior Space is the first major anthropometrically based reference book of design standards for use by all those involved with the physical planning and detailing of interiors, including interior designers, architects, furniture designers, builders, industrial designers, and students of design. The use of anthropometric data,

although no substitute for good design or sound professional judgment should be viewed as one of the many tools required in the design process. This comprehensive overview of anthropometrics consists of three parts. The first part deals with the theory and application of anthropometrics and includes a special section dealing with physically disabled and elderly people. It provides the designer with the fundamentals of anthropometrics and a basic understanding of how interior design standards are established. The second part contains easy-to-read, illustrated anthropometric tables, which provide the most current data available on human body size, organized by age and percentile groupings. Also included is data relative to the range of joint motion and body sizes of children. The third part contains hundreds of dimensioned drawings, illustrating in plan and section the proper anthropometrically based relationship between user and space. The types of spaces range from

residential and commercial to recreational and institutional, and all dimensions include metric conversions. In the Epilogue, the authors challenge the interior design profession, the building industry, and the furniture manufacturer to seriously explore the problem of adjustability in design. They expose the fallacy of designing to accommodate the so-called average man, who, in fact, does not exist. Using government data, including studies prepared by Dr. Howard Stoudt, Dr. Albert Damon, and Dr. Ross McFarland, formerly of the Harvard School of Public Health, and Jean Roberts of the U.S. Public Health Service, Panero and Zelnik have devised a system of interior design reference standards, easily understood through a series of charts and situation drawings. With Human Dimension and Interior Space, these standards are now accessible to all designers of interior environments.

International Building Code 2018 - International Code Council 2017

This code applies to all buildings except detached one- and two-family dwellings and townhouses up to three stories. The 2018 IBC contains many important changes such as: Accessory storage spaces of any size are now permitted to be classified as part of the occupancy to which they are accessory. New code sections have been introduced addressing medical gas systems and higher education laboratories. Use of fire walls to create separate buildings is now limited to only the determination of permissible types of construction based on allowable building area and height. Where an elevator hoistway door opens into a fire-resistance-rated corridor, the opening must be protected in a manner to address smoke intrusion into the hoistway. The

occupant load factor for business uses has been revised to one occupant per 150 square feet. Live loads on decks and balconies increase the deck live load to one and one-half times the live load of the area served. The minimum lateral load that fire walls are required to resist is five pounds per square foot. Wind speed maps updated, including maps for the state of Hawaii. Terminology describing wind speeds has changed again with ultimate design wind speeds now called basic design wind speeds. Site soil coefficients now correspond to the newest generation of ground motion attenuation equations (seismic values). Five-foot tall wood trusses requiring permanent bracing must have a periodic special inspection to verify that the required bracing has been installed. New alternative fastener schedule for construction of mechanically laminated decking is added giving equivalent power-driven fasteners for the 20-penny nail. Solid sawn lumber header and girder spans for the exterior bearing walls reduce span

lengths to allow #2 Southern Pine design values. *ICC A117.1-2009 Standard and Commentary* - International Code Council 2012
